

Squares are 0.5" x 0.5"

This design for the arm of the quadcopter drone attaches to each corner of the drone's body. Each arm will come out diagonally. At the end of the arm is a one inch in diameter, one inch deep circular hole where the motor will be placed. The arm then bends downward and this bent part acts as the leg which the drone stands upon. Acting as extra support for the leg and the arm of the drone is a diagonal beam. It will break down some of the force from the motor.
