Squares are 15 x 15 mm
Units are Millimeters

My design features a long arm that bends down into the leg with a fillet on the outside and a chamfer on the inside for aesthetics and to remove sharp corners. An additional pair of ribs connect the arm and leg for additional stability to support the payload. The motor mount extends out from the arm cylindrically and has a smaller cylindrical hole for the motor to be placed in. On the other end of the arm is the diagonal ninety degree drone mount location, as each of the four arms is intended to be attached to each corner of the drone body.
